Recorded message: (202) 606-5306

BEA 05-06

GROSS DOMESTIC PRODUCT: FOURTH QUARTER 2004 (PRELIMINARY)

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 3.8 percent in the fourth quarter of 2004, according to preliminary estimates released by the Bureau of Economic Analysis. In the third quarter, real GDP increased 4.0 percent.

The GDP estimates released today are based on more complete source data than were available for the advance estimates issued last month. In the advance estimates, the increase in real GDP was 3.1 percent (see "Revisions" on page 3).

The major contributors to the increase in real GDP in the fourth quarter were personal consumption expenditures (PCE), equipment and software, and private inventory investment. Imports, which are a subtraction in the calculation of GDP, increased.

The small deceleration in real GDP growth in the fourth quarter primarily reflected an acceleration in imports of goods and decelerations in PCE for durable goods and in exports of goods that were partly offset by an upturn in private inventory investment.

Final sales of computers contributed 0.56 percentage point to the fourth-quarter change in real GDP after contributing 0.18 percentage point to the third-quarter change. Motor vehicle output contributed 0.84 percentage point to the fourth-quarter change in real GDP after contributing 0.34 percentage point to the third-quarter change.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 2.8 percent in the fourth quarter, 0.1 percentage point more than the advance estimate; this index increased 1.9 percent in the third quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 1.9 percent in the fourth quarter, compared with an increase of 1.7 percent in the third.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on BEA's Web site at www.bea.gov/bea/rels.htm.

Real personal consumption expenditures increased 4.2 percent in the fourth quarter, compared with an increase of 5.1 percent in the third. Real nonresidential fixed investment increased 14.0 percent, compared with an increase of 13.0 percent. Nonresidential structures increased 1.2 percent, in contrast to a decrease of 1.1 percent. Equipment and software increased 18.0 percent, compared with an increase of 17.5 percent. Real residential fixed investment increased 2.1 percent, compared with an increase of 1.6 percent.

Real exports of goods and services increased 2.4 percent in the fourth quarter, compared with an increase of 6.0 percent in the third. Real imports of goods and services increased 11.4 percent, compared with an increase of 4.6 percent.

Real federal government consumption expenditures and gross investment increased 1.7 percent in the fourth quarter, compared with an increase of 4.8 percent in the third. National defense decreased 0.3 percent, in contrast to an increase of 10.1 percent. Nondefense increased 6.3 percent, in contrast to a decrease of 5.3 percent. Real state and local government consumption expenditures and gross investment increased 0.8 percent, in contrast to a decrease of 1.7 percent.

The real change in private inventories added 0.60 percentage point to the fourth-quarter change in real GDP after subtracting 0.97 percentage point from the third-quarter change. Private businesses increased inventories \$51.0 billion in the fourth quarter, following increases of \$34.5 billion in the third quarter and \$61.1 billion in the second.

Real final sales of domestic product -- GDP less change in private inventories -- increased 3.2 percent in the fourth quarter, compared with an increase of 5.0 percent in the third.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 5.0 percent in the fourth quarter, compared with an increase of 3.9 percent in the third.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 6.0 percent, or \$174.0 billion, in the fourth quarter to a level of \$11,988.9 billion. In the third quarter, current-dollar GDP increased 5.5 percent, or \$157.4 billion.

Revisions

The preliminary estimate of the fourth-quarter increase in real GDP is 0.7 percentage point, or \$17.6 billion, higher than the advance estimate issued last month. The upward revision to the percentage change in real GDP primarily reflected upward revisions to exports of goods, to private nonfarm inventory investment, and to equipment and software that were partly offset by an upward revision to imports of goods and a downward revision to personal consumption expenditures for durable goods.

	<u>Advance</u>	<u>Preliminary</u>
	(Percent change from preceding quarter)	
Real GDP.....	3.1	3.8
Current-dollar GDP.....	5.3	6.0
Gross domestic purchases price index...	2.7	2.8

2004 GDP

Real GDP increased 4.4 percent in 2004 (that is, from the 2003 annual level to the 2004 annual level), compared with an increase of 3.0 percent in 2003.

The major contributors to the increase in real GDP in 2004 were personal consumption expenditures (PCE), equipment and software, exports, residential fixed investment, private inventory investment, and federal government spending. Imports, which are a subtraction in the calculation of GDP, increased in 2004.

The acceleration in real GDP in 2004 primarily reflected an acceleration in exports, an upturn in private inventory investment, and accelerations in equipment and software and in PCE that were partly offset by an acceleration in imports.

The price index for gross domestic purchases increased 2.4 percent in 2004, compared with an increase of 2.0 percent in 2003.

Current-dollar GDP increased 6.6 percent, or \$729.5 billion, in 2004. Current-dollar GDP increased 4.9 percent, or \$517.0 billion, in 2003.

During 2004 (that is, measured from the fourth quarter of 2003 to the fourth quarter of 2004), real GDP increased 3.9 percent. Real GDP increased 4.4 percent during 2003. The price index for gross domestic purchases increased 2.9 percent during 2004, compared with an increase of 1.8 percent during 2003.

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at www.bea.gov. By visiting the site, you can also subscribe to receive free e-mail summaries of BEA releases and announcements.

Summary BEA estimates are available on recorded messages at the time of public release at the following telephone numbers:

(202)	606-5306	Gross domestic product
(202)	606-5303	Personal income and outlays
(202)	606-5362	U.S. international transactions

¹ This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. Percentage changes for these series are included in the addenda to table 8 and appendix table A.
See "Explanatory Note" at the end of the tables.

^r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the third quarter of 2004.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets, and personal current transfer receipts.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

r Revised.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions.

See "Explanatory Note" at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or “real” measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2002-03 annual percent change in real GDP uses prices for 2002 and 2003 as weights, and the 2002-03 annual percent change in GDP prices uses quantities for 2002 and 2003 as weights. These annual changes are “chained” (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding “chain-type” price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, and 8. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated “chained (2000) dollar estimates.” For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 (= \$100 x 110 / 100). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a “residual” line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
