Recorded message: 606-5306

BEA 03-09

GROSS DOMESTIC PRODUCT: FOURTH QUARTER 2002 (FINAL)
CORPORATE PROFITS: FOURTH QUARTER 2002

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 1.4 percent in the fourth quarter of 2002, according to revised estimates released by the Bureau of Economic Analysis. In the third quarter, real GDP increased 4.0 percent.

The GDP estimates released today are based on more complete source data than were available for the preliminary estimates issued last month. In the preliminary estimates, the increase in real GDP was also 1.4 percent (see "Revisions" on page 3).

The major contributors to the increase in real GDP in the fourth quarter were personal consumption expenditures (PCE), government spending, equipment and software, residential fixed investment, and private inventory investment. The contributions of these components were partly offset by negative contributions from exports and from nonresidential structures. Imports, which are a subtraction in the calculation of GDP, increased.

The deceleration in real GDP growth in the fourth quarter primarily reflected a deceleration in PCE, a downturn in exports, and a deceleration in private inventory investment that were partly offset by an acceleration in federal government spending, a smaller decrease in nonresidential structures, and an acceleration in residential fixed investment. Imports accelerated in the fourth quarter.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (1996) dollars. Price indexes are chain-type measures.

This news release is available on BEA's Web site at <www.bea.gov/bea/rels.htm>.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 1.8 percent in the fourth quarter, 0.2 percentage point more than in the preliminary estimate; this index increased 1.2 percent in the third quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 1.5 percent in the fourth quarter, compared with an increase of 1.2 percent in the third.

Real personal consumption expenditures increased 1.7 percent in the fourth quarter, compared with an increase of 4.2 percent in the third. Real nonresidential fixed investment increased 2.3 percent, in contrast to a decrease of 0.8 percent. Nonresidential structures decreased 9.9 percent, compared with a decrease of 21.4 percent. Equipment and software increased 6.2 percent, compared with an increase of 6.7 percent. Real residential fixed investment increased 9.4 percent, compared with an increase of 1.1 percent.

Real exports of goods and services decreased 5.8 percent in the fourth quarter, in contrast to an increase of 4.6 percent in the third. Real imports of goods and services increased 7.4 percent, compared with an increase of 3.3 percent.

Real federal government consumption expenditures and gross investment increased 11.0 percent in the fourth quarter, compared with an increase of 4.3 percent in the third. National defense increased 11.0 percent, compared with an increase of 6.9 percent. Nondefense increased 11.1 percent, in contrast to a decrease of 0.3 percent. Real state and local government consumption expenditures and gross investment increased 1.2 percent, compared with an increase of 2.2 percent.

The real change in private inventories added 0.28 percentage point to the fourth-quarter change in real GDP, after adding 0.58 percentage point to the third-quarter change. Private businesses increased inventories \$25.8 billion in the fourth quarter, following increases of \$18.8 billion in the third quarter and \$4.9 billion in the second.

Real final sales of domestic product -- GDP less change in private inventories -- increased 1.1 percent in the fourth quarter, compared with an increase of 3.4 percent in the third.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 2.9 percent in the fourth quarter, compared with an increase of 3.9 percent in the third.

Gross national product

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 1.4 percent in the fourth quarter, compared with an increase of 4.4 percent in the third. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which increased \$1.5 billion in the fourth quarter after increasing \$8.2 billion in the third; in the fourth quarter, receipts decreased \$3.8 billion, and payments decreased \$5.3 billion.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 3.2 percent, or \$82.6 billion, in the fourth quarter to a level of \$10,588.8 billion. In the third quarter, current-dollar GDP increased 5.1 percent, or \$129.3 billion.

Revisions

The final estimate of the fourth-quarter increase in real GDP is the same as the preliminary estimate, primarily reflecting a downward revision to exports of services that was offset by an upward revision to personal consumption expenditures for services.

	<u>Advance</u> (Percent change from preceding quarter)	<u>Preliminary</u>	<u>Final</u>
Real GDP.....	0.7	1.4	1.4
Current-dollar GDP.....	2.5	3.1	3.2
Gross domestic purchases price index.....	1.8	1.6	1.8

Corporate Profits

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$25.1 billion in the fourth quarter, in contrast to a decrease of \$14.0 billion in the third. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- increased \$14.0 billion in the fourth quarter, in contrast to a decrease of \$12.0 billion in the third.

Domestic profits of financial corporations increased \$0.3 billion in the fourth quarter, in contrast to a decrease of \$3.4 billion in the third.

Domestic profits of nonfinancial corporations increased \$26.8 billion in the fourth quarter, in contrast to a decrease of \$11.7 billion in the third. In the fourth quarter, both real gross corporate product and profits per unit of real product increased. The increase in unit profits reflected an increase in the prices corporations received and a decrease in the unit nonlabor costs incurred by corporations; unit labor costs were unchanged from the third quarter.

The rest-of-the-world component of profits decreased \$2.0 billion in the fourth quarter, in contrast to an increase of \$1.0 billion in the third. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The fourth-quarter decrease was accounted for by a larger increase in payments than in receipts.

Profits before tax with inventory valuation adjustment is the best available measure of industry profits because estimates of the capital consumption adjustment by industry do not exist. This measure reflects the depreciation-accounting practices used for federal income tax returns. According to this measure, both domestic profits of financial corporations and domestic profits of nonfinancial corporations increased. Profit increases of nonfinancial corporations were widespread among major industry groups; the largest increases occurred in wholesale trade and in "other" nonmanufacturing. Profits decreased in retail trade.

Profits before tax increased \$26.4 billion in the fourth quarter, compared with an increase of \$10.6 billion in the third. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment decreased \$7.9 billion in the fourth quarter (from \$117.6 billion to \$109.7 billion), compared with a decrease of \$15.2 billion in the third. The inventory valuation adjustment increased \$6.6 billion (from -\$15.1 billion to -\$8.5 billion), in contrast to a decrease of \$9.4 billion.

Profits tax liability increased \$7.7 billion in the fourth quarter, compared with an increase of \$1.0 billion in the third. Profits after tax increased \$18.7 billion, compared with an increase of \$9.5 billion. Dividends increased \$6.6 billion, compared with an increase of \$6.9 billion; undistributed profits increased \$12.1 billion, compared with an increase of \$2.6 billion.

Corporate profits in 2002

Profits from current production increased 7.6 percent in 2002, in contrast to a decrease of 7.2 percent in 2001. Domestic profits increased 15.0 percent, in contrast to a decrease of 9.9 percent. The rest-of-the-world component of profits decreased 20.9 percent, in contrast to an increase of 5.2 percent.

Profits before tax decreased 0.7 percent in 2002, compared with a decrease of 14.3 percent in 2001. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. In 2002, the difference between the increase in profits from current production and the decrease in profits before tax was mainly due to an increase in the capital consumption adjustment. The increase in the capital consumption adjustment reflected the effect of the Job Creation and Worker Assistance Act of 2002 that allowed accelerated depreciation and lowered before-tax profits. Profits from current production were not affected by the act, because they do not depend on the depreciation-accounting practices used for federal income tax purposes.

Profits tax liability increased 7.0 percent in 2002, in contrast to a decrease of 23.2 percent in 2001. Profits after tax decreased 4.0 percent, compared with a decrease of 10.0 percent. Dividends increased 6.0 percent, compared with an increase of 8.9 percent; undistributed profits decreased 71.2 percent, compared with a decrease of 58.3 percent.

^r revised

NOTE.—Users are cautioned that particularly for components for which relative prices are changing rapidly, the use of chained-dollar estimates to calculate component shares or component contributions to real growth may be misleading even just a few years from the base year. For accurate estimates of the contributions to percent changes in real GDP, use table 2.

See "Explanatory Note" at the end of the tables.

Table 4.—Chain-Type Price Indexes for Gross Domestic Product and Related Measures: Percent Change From Preceding Period

^r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the third quarter of 2002.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, net interest, contributions for social insurance, and wage accruals less disbursements, plus personal interest income, personal dividend income, government transfer payments to persons, and business transfer payments to persons.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the third quarter of 2002.

1. Effective November 26, 2002, the estimates of chained-dollar gross product of nonfinancial corporate business beginning with 1999 have been revised to reflect the 2002 revision to the gross product price indexes for non-financial industries.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 1996 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net product of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.

4. The deflator for gross product of nonfinancial corporate business divided by 100.

^r revised.

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross product of farm, of housing, of households and institutions, and of general government.

See "Explanatory Note" at the end of the tables.

Explanatory Note: Measures of Output and Prices

This note describes the calculation of chain-type quantity and price indexes used in the NIPA's.

Changes in current-dollar GDP measure changes in the market value of goods, services, and structures produced in the economy in a particular period. These changes can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year--at present, the year 1996--equal to 100.

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2000-01 annual percent change in real GDP uses prices for 2000 and 2001 as weights, and the 2000-01 annual percent change in GDP prices uses quantities for 2000 and 2001 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. The Fisher formula produces percent changes in quantities and prices that are not affected by the choice of reference years. In addition, because the changes in quantities and prices calculated in this way are symmetric, in general, the product of a quantity index and the corresponding price index equals the current-dollar index. (BEA also publishes a measure of the price level known as the "implicit price deflator (IPD)," which is calculated as the ratio of current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index for all periods.)

Chain-type quantity and price indexes for GDP and its major components are presented in this release as index numbers in table 5 and in the form of percentage changes from the preceding period in tables 1, 4, 6 and from the quarter one year ago in table 7. Contributions by major components to changes in real GDP are presented in table 2. BEA also prepares measures of real GDP and its components in a dollar-denominated form, designated "chained (1996) dollar estimates." For GDP and most other series, these estimates, which are presented in table 3, are computed by multiplying the 1996 current-dollar value by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 1996 and if real output for this component increased 10 percent in 1997, then the chained (1996) dollar value of this component in 1997 would be \$110 (\$100 x 1.10).

For analyses of changes over time in an aggregate or in a component, the percentage changes calculated from the chained-dollar estimates and from the chain-type quantity indexes are the same; any differences will be small and due to rounding. However, because the relative prices used as weights for any period other than the reference year differ from those used for the reference year, the chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP or to any intermediate aggregate. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or another major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights for the chain-type index, the residuals tend to be small, and the chained (1996) dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. As one moves further from the reference year, the residual tends to become larger, and the chained-dollar estimates become less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
