

# NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EST, TUESDAY, NOVEMBER 25, 2008

Lisa Mataloni: (202) 606-5304 (GDP)  
Andrew Hodge: (202) 606-5564 (Profits)  
Recorded message: (202) 606-5306

BEA 08-51

## **GROSS DOMESTIC PRODUCT: THIRD QUARTER 2008 (PRELIMINARY) CORPORATE PROFITS: THIRD QUARTER 2008 (PRELIMINARY)**

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- decreased at an annual rate of 0.5 percent in the third quarter of 2008, (that is, from the second quarter to the third quarter), according to preliminary estimates released by the Bureau of Economic Analysis. In the second quarter, real GDP increased 2.8 percent.

The GDP estimates released today are based on more complete source data than were available for the advance estimates issued last month. In the advance estimates, the decrease in real GDP was 0.3 percent (see "Revisions" on page 3).

The decrease in real GDP in the third quarter primarily reflected negative contributions from personal consumption expenditures (PCE), residential fixed investment, and equipment and software that were partly offset by positive contributions from federal government spending, private inventory investment, exports, nonresidential structures, and state and local government spending. Imports, which are a subtraction in the calculation of GDP, decreased.

Most of the major components contributed to the downturn in real GDP growth in the third quarter. The largest contributors were a sharp downturn in PCE, a deceleration in exports, a smaller decrease in imports, and decelerations in nonresidential structures and in state and local government spending. Notable offsets were an upturn in inventory investment and an acceleration in federal government spending.

---

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and are annualized. "Real" estimates are in chained (2000) dollars. Price indexes are chain-type measures.

This news release is available on [BEA's Web site](#) along with the [Technical Note](#) and [Highlights](#) related to this release.

Final sales of computers added 0.03 percentage point to the third-quarter change in real GDP after adding 0.17 percentage point to the second-quarter change. Motor vehicle output added 0.20 percentage point to the third-quarter change in real GDP after subtracting 1.01 percentage points from the second-quarter change.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 4.7 percent in the third quarter, 0.1 percentage point less than in the advance estimate; this index increased 4.2 percent in the second quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 3.0 percent in the third quarter, compared with an increase of 2.2 percent in the second.

Real personal consumption expenditures decreased 3.7 percent in the third quarter, in contrast to an increase of 1.2 percent in the second. Real nonresidential fixed investment decreased 1.5 percent, in contrast to an increase of 2.5 percent. Nonresidential structures increased 6.6 percent, compared with an increase of 18.5 percent. Equipment and software decreased 5.7 percent, compared with a decrease of 5.0 percent. Real residential fixed investment decreased 17.6 percent, compared with a decrease of 13.3 percent.

Real exports of goods and services increased 3.4 percent in the third quarter, compared with an increase of 12.3 percent in the second. Real imports of goods and services decreased 3.2 percent, compared with a decrease of 7.3 percent.

Real federal government consumption expenditures and gross investment increased 13.6 percent in the third quarter, compared with an increase of 6.6 percent in the second. National defense increased 18.0 percent, compared with an increase of 7.3 percent. Nondefense increased 4.5 percent, compared with an increase of 5.0 percent. Real state and local government consumption expenditures and gross investment increased 0.8 percent, compared with an increase of 2.5 percent.

The real change in private inventories added 0.89 percentage point to the third-quarter change in real GDP, after subtracting 1.50 percentage points from the second-quarter change. Private businesses decreased inventories \$29.1 billion in the third quarter, following a decrease of \$50.6 billion in the second quarter and a decrease of \$10.2 billion in the first.

Real final sales of domestic product -- GDP less change in private inventories -- decreased 1.4 percent in the third quarter, in contrast to an increase of 4.4 percent in the second.

### **Gross domestic purchases**

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- decreased 1.5 percent in the third quarter, compared with a decrease of 0.1 percent in the second.

### **Gross national product**

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- decreased 0.4 percent in the third quarter, in contrast to an increase of 2.1 percent in the second. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which increased \$2.4 billion in the third quarter after decreasing \$20.2 billion in the second; in the third quarter, receipts decreased \$21.3 billion, and payments decreased \$23.6 billion.

### **Current-dollar GDP**

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 3.6 percent, or \$126.0 billion, in the third quarter to a level of \$14,420.5 billion. In the second quarter, current-dollar GDP increased 4.1 percent, or \$143.7 billion.

### **Revisions**

The preliminary estimate of the third-quarter decrease in real GDP is 0.2 percentage point, or \$7.7 billion, lower than the advance estimate issued last month. The downward revision to the percent change in real GDP primarily reflected downward revisions to personal consumption expenditures and to exports that were partly offset by an upward revision to private nonfarm inventory investment and a downward revision to imports.

	<u>Advance</u>	<u>Preliminary</u>
	(Percent change from preceding quarter)	
Real GDP.....	-0.3	-0.5
Current-dollar GDP.....	3.8	3.6
Gross domestic purchases price index....	4.8	4.7

### **Corporate Profits**

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) decreased \$14.6 billion in the third quarter, compared with a decrease of \$60.2 billion in the second quarter. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- increased \$43.5 billion in the third quarter, in contrast to a decrease of \$60.5 billion in the second.

Third quarter profits from current production were reduced by \$46.2 billion because of Hurricane Ike, reflecting the net benefits paid by domestic insurance companies and uninsured losses of corporate property.

Taxes on corporate income decreased \$9.9 billion in the third quarter, in contrast to an increase of \$3.9 billion in the second. Profits after tax with inventory valuation and capital consumption adjustments decreased \$4.7 billion in the third quarter, compared with a decrease of \$64.1 billion in the second. Dividends decreased \$5.0 billion in contrast to an increase of \$13.9 billion; current-production undistributed profits increased \$0.4 billion, in contrast to a decrease of \$78.1 billion.

Domestic profits of financial corporations decreased \$61.6 billion in the third quarter, compared with a decrease of \$31.0 billion in the second. Domestic profits of nonfinancial corporations increased \$47.9 billion in the third quarter, in contrast to a decrease of \$4.2 billion in the second. In the third quarter, real gross value added of nonfinancial corporations increased, and profits per unit of real value added increased. The increase in unit profits reflected an increase in unit prices that was partly offset by an increase in unit nonlabor costs; unit labor costs were unchanged.

The rest-of-the-world component of profits decreased \$0.9 billion in the third quarter, compared with a decrease of \$25.0 billion in the second. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The third-quarter decrease was accounted for by a larger decrease in receipts than in payments.

Profits before tax decreased \$50.7 billion in the third quarter, compared with a decrease of \$0.9 billion in the second. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment decreased \$25.5 billion in the third quarter (from -\$62.7 billion to -\$88.2 billion), compared with a decrease of \$14.7 billion in the second. The inventory valuation adjustment increased \$61.6 billion (from -\$154.0 billion to -\$92.4 billion), in contrast to a decrease of \$44.6 billion.

† Revised

<sup>1</sup> This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. Percentage changes for these series are included in the addenda to table 8 and appendix table A.

See "Explanatory Note" at the end of the tables.

Disposable personal income, billions of chained (2000) dollars <sup>2</sup>	8,121.4	8,407.0	8,644.0	8,671.1	8,683.1	8,667.9	8,891.0	8,679.5	

<sup>r</sup> Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2008.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets, and personal current transfer receipts.

2. Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

<sup>r</sup> Revised. Revisions include changes to series affected by the incorporation of revised wage and salary estimates for the second quarter of 2008.

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE. Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

<sup>1</sup> Revised

<sup>2</sup> For some components of final sales of computers, includes computer parts.

<sup>3</sup> Farm output less intermediate goods and services purchased.

<sup>4</sup> Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions.

See "Explanatory Note" at the end of the tables.

### **Explanatory Note: NIPA Measures of Quantities and Prices**

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2006-07 annual percent change in real GDP uses prices for 2006 and 2007 as weights, and the 2006-07 annual percent change in GDP prices uses quantities for 2006 and 2007 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, 8, and Appendix Table A. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ( $= \$100 \times 110 / 100$ ). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
