

NEWS RELEASE

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, MAY 25, 2006

Virginia H. Mannering: (202) 606-5304 (GDP)
Greg Key: (202) 606-9727 (Profits)
Recorded message: (202) 606-5306

BEA 06-20

GROSS DOMESTIC PRODUCT: FIRST QUARTER 2006 (PRELIMINARY) CORPORATE PROFITS: FIRST QUARTER 2006 (PRELIMINARY)

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 5.3 percent in the first quarter of 2006, according to preliminary estimates released by the Bureau of Economic Analysis. In the fourth quarter, real GDP increased 1.7 percent.

The GDP estimates released today are based on more complete source data than were available for the advance estimates issued last month. In the advance estimates, the increase in real GDP was 4.8 percent (see "Revisions" on page 3).

The increase in real GDP in the first quarter primarily reflected positive contributions from personal consumption expenditures (PCE), exports, equipment and software, and federal government spending. Imports, which are a subtraction in the calculation of GDP, increased.

The acceleration in real GDP growth in the first quarter primarily reflected an upturn in PCE for durable goods, an acceleration in exports, an upturn in federal government spending, and an acceleration in equipment and software that were partly offset by a downturn in private inventory investment.

Final sales of computers contributed 0.05 percentage point to the first-quarter growth in real GDP after contributing 0.33 percentage point to the fourth-quarter growth. Motor vehicle output subtracted 0.11 percentage point from the first-quarter growth in real GDP after subtracting 0.64 percentage point from the fourth-quarter growth.

NOTE.--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (2000) dollars. Prices indexes are chain-type measures.

This new release is available on BEA's Web site at www.bea.gov/bea/rels.htm.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 2.8 percent in the first quarter, 0.1 percentage point more than in the advance estimate; this index increased 3.7 percent in the fourth quarter. Excluding food and energy prices, the price index for gross domestic purchases increased 3.2 percent in the first quarter, the same increase as in the fourth. About 0.2 percentage point of the first-quarter increase in the index was accounted for by the pay raise for federal civilian and military personnel, which is treated as an increase in the price index of employee services purchased by the federal government.

Real personal consumption expenditures increased 5.2 percent in the first quarter, compared with an increase of 0.9 percent in the fourth. Real nonresidential fixed investment increased 13.1 percent, compared with an increase of 4.5 percent. Nonresidential structures increased 11.3 percent, compared with an increase of 3.1 percent. Equipment and software increased 13.8 percent, compared with an increase of 5.0 percent. Real residential fixed investment increased 3.1 percent, compared with an increase of 2.8 percent.

Real exports of goods and services increased 14.7 percent in the first quarter, compared with an increase of 5.1 percent in the fourth. Real imports of goods and services increased 12.8 percent, compared with an increase of 12.1 percent.

Real federal government consumption expenditures and gross investment increased 10.5 percent in the first quarter, in contrast to a decrease of 2.6 percent in the fourth. National defense increased 9.6 percent, in contrast to a decrease of 8.9 percent. Nondefense increased 12.2 percent, compared with an increase of 11.7 percent. Real state and local government consumption expenditures and gross investment increased 0.8 percent, compared with an increase of 0.2 percent.

The real change in private inventories subtracted 0.14 percentage point from the first-quarter change in real GDP, after adding 1.89 percentage points to the fourth-quarter change. Private businesses increased inventories \$32.3 billion in the first quarter, following an increase of \$37.9 billion in the fourth quarter and a decrease of \$13.3 billion in the third.

Real final sales of domestic product -- GDP less change in private inventories -- increased 5.5 percent in the first quarter, in contrast to a decrease of 0.2 percent in the fourth.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 5.5 percent in the first quarter, compared with an increase of 2.9 percent in the fourth.

Gross national product

Real gross national product -- the goods and services produced by the labor and property supplied by U.S. residents -- increased 5.2 percent in the first quarter, compared with an increase of 0.7 percent in the fourth. GNP includes, and GDP excludes, net receipts of income from the rest of the world, which decreased \$3.1 billion in the first quarter after decreasing \$25.6 billion in the fourth; in the first quarter, receipts increased \$28.1 billion, and payments increased \$31.2 billion.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 8.8 percent, or \$271.3 billion, in the first quarter to a level of \$13,037.4 billion. In the fourth quarter, current-dollar GDP increased 5.2 percent, or \$160.4 billion.

Revisions

The preliminary estimate of the first-quarter increase in real GDP is 0.5 percentage point, or \$13.3 billion, more than the advance estimate issued last month. The upward revision to the percentage change in real GDP primarily reflected upward revisions to private inventory investment and to exports that were partly offset by downward revisions to personal consumption expenditures for services and to equipment and software.

	<u>Advance</u>	<u>Preliminary</u>
	(Percent change from preceding quarter)	
Real GDP.....	4.8	5.3
Current-dollar GDP.....	8.2	8.8
Gross domestic purchases price index...	2.7	2.8

Corporate Profits

Profits from current production (corporate profits with inventory valuation and capital consumption adjustments) increased \$116.5 billion in the first quarter, compared with an increase of \$185.8 billion in the fourth. Current-production cash flow (net cash flow with inventory valuation and capital consumption adjustments) -- the internal funds available to corporations for investment -- increased \$84.6 billion in the first quarter, compared with an increase of \$43.1 billion in the fourth.

Fourth-quarter profits from current production were reduced by \$22.9 billion because of Hurricane Wilma, reflecting the net benefits paid by domestic insurance companies and the uninsured losses of corporate property.

Taxes on corporate income increased \$23.2 billion in the first quarter, compared with an increase of \$56.8 billion in the fourth. Profits after tax with inventory valuation and capital consumption adjustments increased \$93.3 billion in the first quarter, compared with an increase of \$129.0 billion in the fourth. Dividends increased \$13.4 billion, compared with an increase of \$15.3 billion; current-production undistributed profits increased \$79.9 billion, compared with an increase of \$113.8 billion.

Domestic profits of financial corporations increased \$67.1 billion in the first quarter, compared with an increase of \$104.9 billion in the fourth. Domestic profits of nonfinancial corporations increased \$40.5 billion, compared with an increase of \$95.5 billion. In the first quarter, real gross corporate value added increased, and profits per unit of real value added increased. The increase in unit profits reflected an increase in unit prices that was partly offset by increases in both unit labor and nonlabor costs that corporations incurred.

The rest-of-the-world component of profits increased \$8.9 billion in the first quarter, in contrast to a decrease of \$14.5 billion in the fourth. This measure is calculated as (1) receipts by U.S. residents of earnings from their foreign affiliates plus dividends received by U.S. residents from unaffiliated foreign corporations minus (2) payments by U.S. affiliates of earnings to their foreign parents plus dividends paid by U.S. corporations to unaffiliated foreign residents. The first-quarter increase was accounted for by a larger increase in receipts than in payments.

Profits before tax increased \$89.8 billion in the first quarter, compared with an increase of \$177.5 billion in the fourth. The before-tax measure of profits does not reflect, as does profits from current production, the capital consumption and inventory valuation adjustments. These adjustments convert depreciation of fixed assets and inventory withdrawals reported on a tax-return, historical-cost basis to the current-cost measures used in the national income and product accounts. The capital consumption adjustment increased \$6.9 billion in the first quarter (from -\$50.7 billion to -\$43.8 billion), compared with an increase of \$21.4 billion in the fourth. The inventory valuation adjustment increased \$19.6 billion (from -\$40.4 billion to -\$20.8 billion), in contrast to a decrease of \$12.9 billion.

BEA's national, international, regional, and industry estimates; the *Survey of Current Business*; and BEA news releases are available without charge on BEA's Web site at www.bea.gov. By visiting the site, you can also subscribe to receive free e-mail summaries of BEA releases and announcements.

Summary BEA estimates are available on recorded messages at the time of public release at the following telephone numbers:

Annual Revision of the National Income and Product Accounts

The annual revision of the national income and product accounts, covering the first quarter of 2003 through the first quarter of 2006, will be released along with the "advance" estimates of GDP for the second quarter of 2006 on July 28. An article describing the revision will appear in the August 2006 issue of the *Survey of Current Business*.

r Revised

1. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions. Percentage changes for these series are included in the addenda to table 8 and appendix table A.

See "Explanatory Note" at the end of the tables.

^r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the fourth quarter of 2005.

¹ Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments, current surplus of government enterprises, and wage accruals less disbursements, plus personal income receipts on assets, and personal current transfer receipts.

² Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

^r Revised. Revisions include changes to series affected by the introduction of revised wage and salary estimates for the fourth quarter of 2005.

1. The current-dollar gross value added is deflated using the gross value added chain-type price index for non-financial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

2. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of

the chain-type quantity index and the 2000 current-dollar value of the corresponding series, divided by 100.

3. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross value added and the consumption of fixed capital.

4. The deflator for gross value added of nonfinancial corporate business divided by 100.

NOTE.—Estimates in this table are based on the 1997 North American Industry Classification System (NAICS).

r Revised

1. For some components of final sales of computers, includes computer parts.

2. Farm output less intermediate goods and services purchased.

3. Consists of GDP less gross value added of farm, of households and institutions, and of general government.

4. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, the services furnished without payment by financial intermediaries) and the expenses of nonprofit institutions.

See "Explanatory Note" at the end of the tables.

Explanatory Note: NIPA Measures of Quantities and Prices

Current-dollar GDP is a measure of the market value of goods, services, and structures produced in the economy in a particular period. Changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year -- at present, the year 2000 -- equal to 100.

Annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 2003-04 annual percent change in real GDP uses prices for 2003 and 2004 as weights, and the 2003-04 annual percent change in GDP prices uses quantities for 2003 and 2004 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. Percent changes in Fisher indexes are not affected by the choice of reference year. (BEA also publishes a measure of the price level known as the implicit price deflator (IPD), which is calculated as the ratio of the current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index.)

Index numbers of quantity and price indexes for GDP and its major components are presented in this release in tables 5 and 6. Percent changes from the preceding period are presented in tables 1, 4, 7, and 8. Contributions by major components to changes in real GDP are presented in table 2.

Measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2000) dollar estimates." For most series, these estimates, which are presented in table 3, are computed by multiplying the current-dollar value in 2000 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2000 and if real output for this component increased 10 percent in 2001, then the chained (2000) dollar value of this component in 2001 would be \$110 ($= \$100 \times 110 / 100$). Percent changes calculated from chained-dollar estimates and from chain-type quantity indexes are the same; any differences will be small and due to rounding.

Chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate). This is because the relative prices used as weights for any period other than the reference year differ from those of the reference year. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or other major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
